

Heavy-duty vehicles CO₂ emissions: EU policy context

Decarbonisation of Heavy Duty Vehicle Transport: Zero Emission Heavy Goods Vehicles 28 October 2020

> Carlos Serra Road transport – DG CLIMA – European Commission

EU HDV CO₂ emissions policy context

- Climate overview
- Where we stand: current CO₂ emission legislation for HDV

✓ Targets

✓ Zero-emission vehicles incentives

✓ Governance provisions

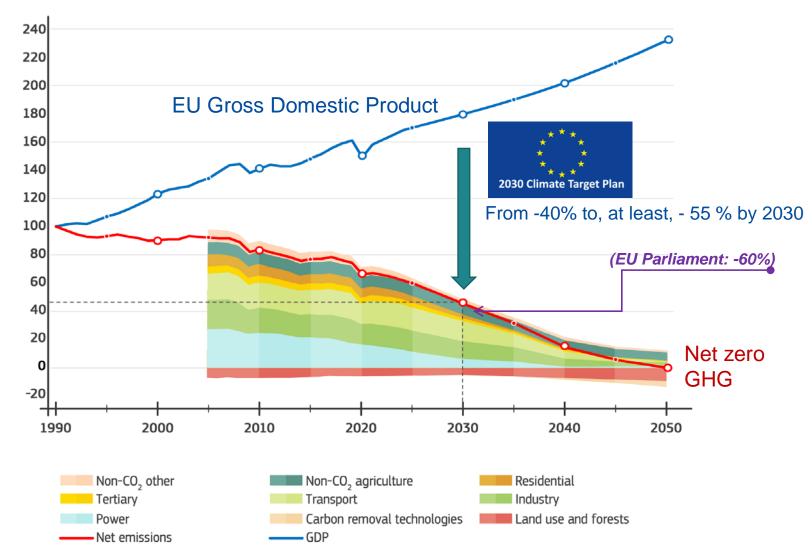

- Where to go:
 - ✓ Next regulatory steps
 - ✓ To-do's
 - ✓ Main issues at stake

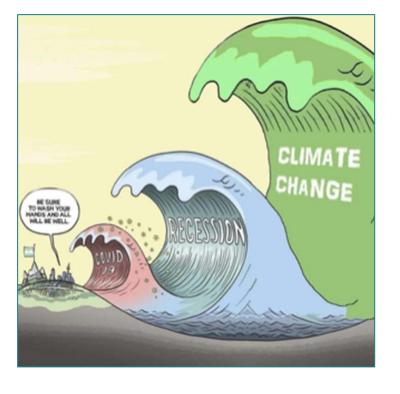

Climate overview

Ambitious approach to climate neutrality by 2050

EU pathway to 2050 climate neutrality

How: Legislative framework

- Commission to include the 2030 Climate Target Plan into the Climate Law
- Updating sectoral legislation under European Green Deal Commitment by June 2021 No HDV CO₂ standards revision expected for 2021
 - EU Emissions Trading System / Market Stability Reserve
 - Carbon Border Adjustment Mechanism
 - Land use, land use change and forestry
 - Effort Sharing
 - Renewable Energy
 - Energy Efficiency/Buildings
 - Energy Taxation Directive

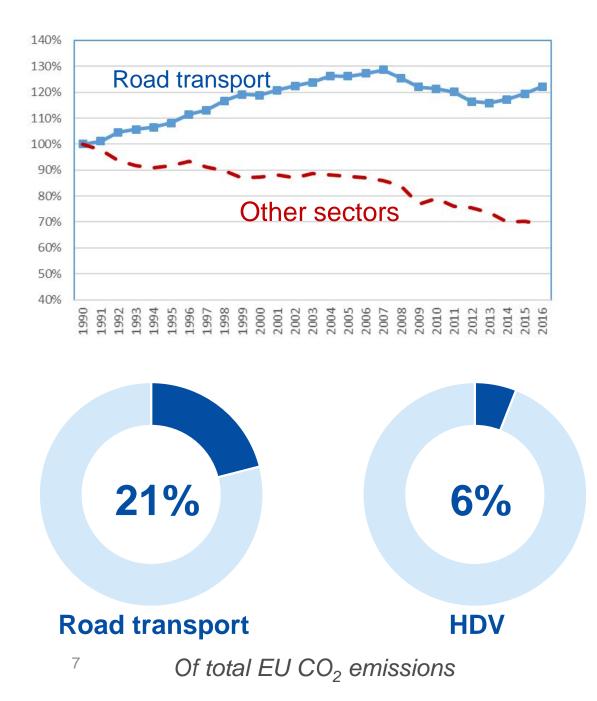

- LDV CO₂ efficiency standards
- Sustainable fuels (shipping, aviation)
- Fuel Quality Directive
- Trans-European Networks (TEN-T, TEN-E)
- Alternative Infrastructure Directive (AFID)
- Fluorinated gases
- State Aid guidelines

Where we stand: current CO₂ EU legislation

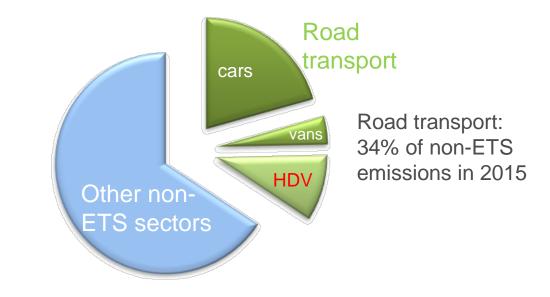

CO₂ emission standards for HDV: Regulation (EU) 2019/1242

EU transport CO₂ emissions figures

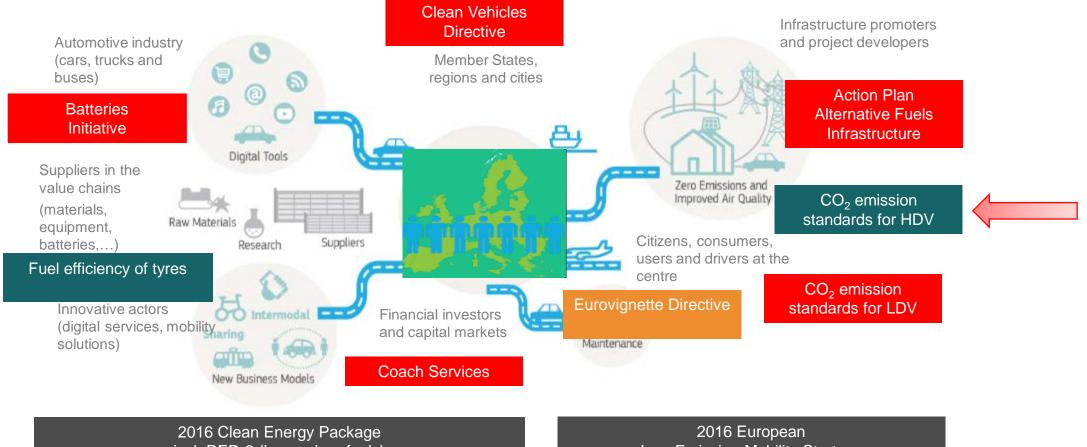

2015 Emissions in non-ETS sectors

Despite some improvements in fuel consumption efficiency in recent years, **HDV CO₂ emissions are still rising**, mainly due to increasing road freight traffic.

Mobility Packages I-III: an integrated approach

incl. RED-2 (low-carbon fuels)

Low-Emission Mobility Strategy

Regulation (EU) 2019/1242: What HDV are regulated?

- Trucks are divided within Regulation 2019/1242 into 18 different vehicle groups
- Scope: As a first step, the CO₂ emission standards cover only some large truck categories: vehicle groups 4,5,9 and 10 with a technically permissible maximum laden mass (TPMLM) > 16t
- Vocational vehicles (garbage trucks, etc.), smaller trucks, buses, coaches... are excluded for the moment of the regulatory scope

Vehicle group	Axle and chassis configuration	Without trailer		
4	4x2 Rigid	,		
5	4x2 Tractor			
9	6x2 Rigid			
10	6x2 Tractor			

Vans up to 3.5 ton are not HDV

4 categories summing up to 2/3 of the total CO₂ emissions from HDVs

Vehicle groups for vehicles of category N (trucks)

Chassis configuration Technically permissible maximum laden mass (tons)	e grou		(6	~			Allocation of mission profile and vehicle configuration					
Ch confi _u Tech perr maxim mas	Vehicle group	Long haul	ong haul (EMS)	Regional delivery	Regional delivery (EMS)	Urban delivery	Municipal utility	Construction

4 categories summing up to 2/3 of the total CO₂ emissions from HDVs

Regulation (EU) 2019/1242: CO₂ targets

Binding CO₂ reduction targets for fleets of new trucks for the regulated HDV categories

- Reduction as compared to the 2019 baseline (= average of all manufacturers).
- For each manufacturer ('specific CO₂ emissions target')
- Sufficient lead time combined with the possibility of early uptake of existing fuel-efficient technologies
- Unit: g CO₂/t km
- Tailpipe based approach. Based on type-approval values
- Full flexibility for manufacturers to balance emissions between the different groups of vehicles within their portfolio, including ZEV contributions, even from non-regulated vehicle categories

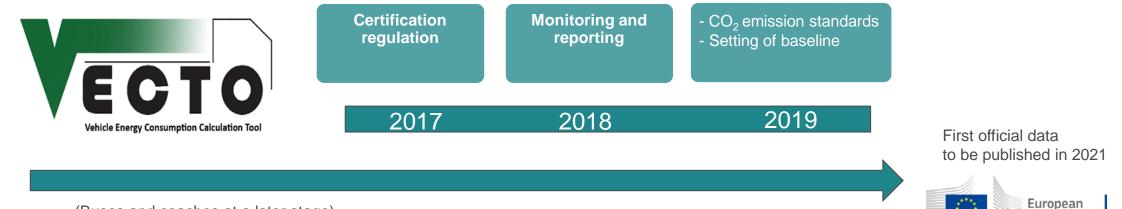

Regulation (EU) 2019/1242: What emissions are regulated?

Commission

- Step-wise approach
- Compliance with targets verified on basis of emissions determined at type approval
- HDV type approval based on VECTO simulation tool as a 'virtual laboratory' to determine fuel consumption and CO2 emissions
- Only for newly registered HDVs placed on the EU market
- Certification regulation: Procedure to calculate CO₂ emissions and fuel consumption with VECTO

Incentive mechanism for ZEV/LEV

- No ZEV / LEV quotas currently
- Scope covering both ZEV and LEV: technology-neutral
- Also smaller ZE trucks with TPMLM < 16t not regulated yet for their CO₂ emissions can contribute to incentives! (ZE buses and coaches excluded)
- Until 2024:
 - Super-credits subject to a <u>3% CO₂ reduction cap (for early adoption credits facilitating compliance in 2025).</u>
 - ZEV counted as two vehicles. LEV *up* to two vehicles according to: its specific CO₂ emissions and the low-emission threshold of the vehicle sub-group to which the vehicle belongs
- From 2025:
 - One-way/bonus-only crediting system based on a 2% benchmark from 2025 onwards
- 2030 ZEV/LEV benchmark to be set by the next Regulatory review in 2022

Low-emission heavy-duty vehicle

Emissions below 50% of the reference CO_2 emission of the sub-group to which the vehicle belongs (other than ZEV)

Zero-emission heavy-duty vehicle

No combustion engine or emissions less than 1 gCO2/kWh* at type-approval of engine

Governance provisions

CO₂ emissions reference baseline

- 2019; review in 2022
- Avoid inflated reference CO₂ emissions baseline
- Setting criteria for determining undue increases and how they should be corrected

Penalties (∉gCO₂/tkm)

- 2025: €4,250
- 2030: €6,800
- Above the marginal cost of meeting the targets → deterrent for manufacturers

Real-world CO2 emissions

- Ensure type-approval certification procedures (VECTO) result in CO₂ emission values representative of real-world emissions
- Prevent an increase of the gap between real and certified emission values
- 2027: Mechanism to adjust concerning 2030 specific manufacturer's emissions, if needed

In-service verification

- Type-approval certification validation of CO₂ emission values in vehicles in use
- Commission to lay down principles and procedures. Verification by Member States (type-approval)

Where to go

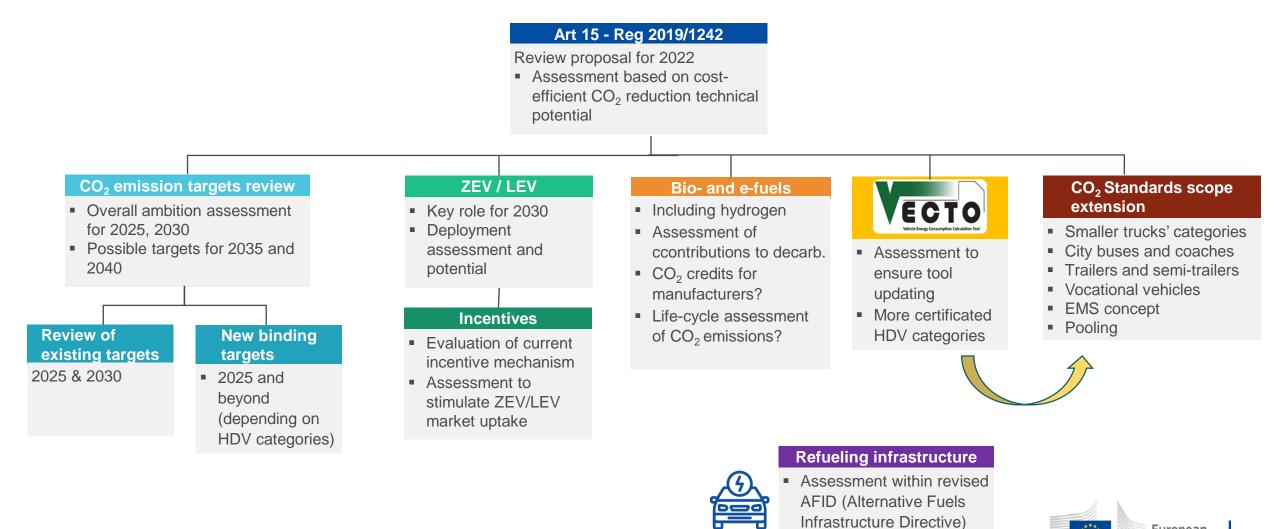

Next regulatory steps: review of CO_2 emission standards for HDV, Regulation 2019/1242

To-do's

Main issues at stake

Review of Regulation (EU) 2019/1242

European Commission

To-Do's: VECTO certification of vehicles

- Buses, coaches, smaller trucks and vehicles with <u>electrified powertrain</u> (pure and hybrid electric) to be included into VECTO certification
- Hybrid electric vehicles:
 - charge depleting/sustaining CO₂ emissions + electric driving range + utility factor
 - regulatory specific CO₂ emissions
- To be made available in type-approval legislation including certification of electric consumption and electric driving range
- Hydrogen internal combustion engines to be introduced into UNECE-R 49 pollutant emission type-approval (in particular PEMS test)
- Technical challenge: handling of different hybrid technologies (parallel, serial, ...); flexible accommodation of innovative concepts
- Utility factor: charging scenarios, in particular for long-haul transport?

Main issues at stake

Clear political objective: Decarbonisation of road transport by 2050!

- Can sustainable bio- and e-fuels contribute significantly to CO2 reductions in road transport considering possible supply and the demand of other sectors in a 'decarbonised' global economy?
- Synthetic / renewable / e- fuels / ? Yes if cost + sustainability issues are to be solved
- How will we use truck vs. rail? To what extent will long-haul operation be relevant for trucks?
- How can ZEV design, infrastructure development and hydrogen/electricity production be aligned?
- ZEV quotas? On which categories?
- Technological neutrality vs need of investment certainty
- Are our solutions globally scalable?
- Role of lighthouse projects (e.g. 'hydrogen valleys' within main EU corridors)

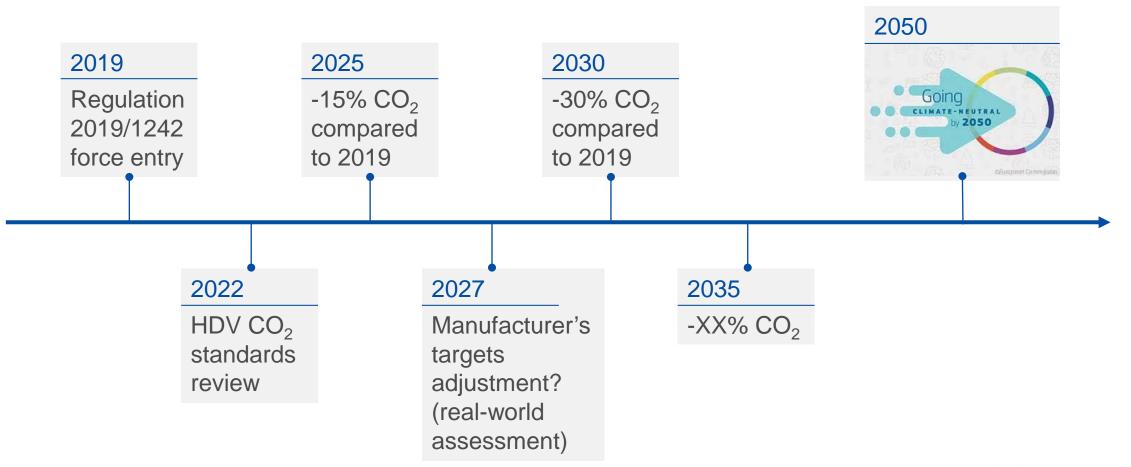

Conclusions

- Decarbonisation of HDV requires a toolbox of different instruments and mainstreaming into a wide range of regulatory and non-regulatory measures
- Future: No single silver bullet for all transport modes; but clean hydrogen seems crucial for decarbonising heavy-duty transport
- To prepare for a transition towards climate neutrality post 2030, zero- and low-carbon technologies will need to be kick-started by right now
- The review of HDV CO2 Standards Regulation by 2022 is possibly only the end of a beginning, but regulatory elements will need continuous adjustments for following technological developments

Timeline
